## Overview

A description of your project. What will it do? What will it look like?

-A cardboard box proxy of a Giant Robot with a light up core. It is a Four armed quadrupedal headless robot, with a modified meteorite as a powersource. Both Arms (the larger ones) are covered by massive armor plates not out of place in Gundam or Armored Core

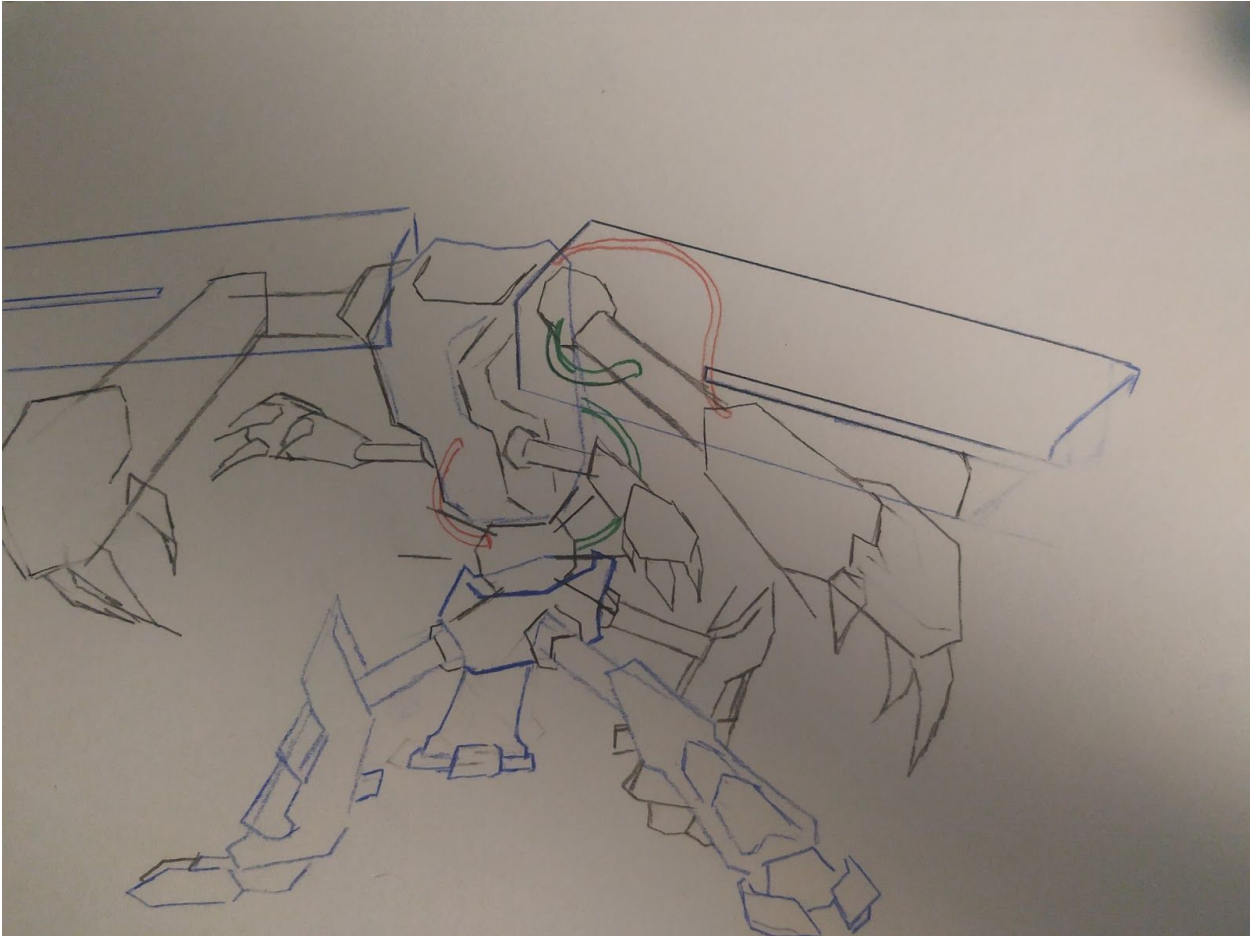

## Goals

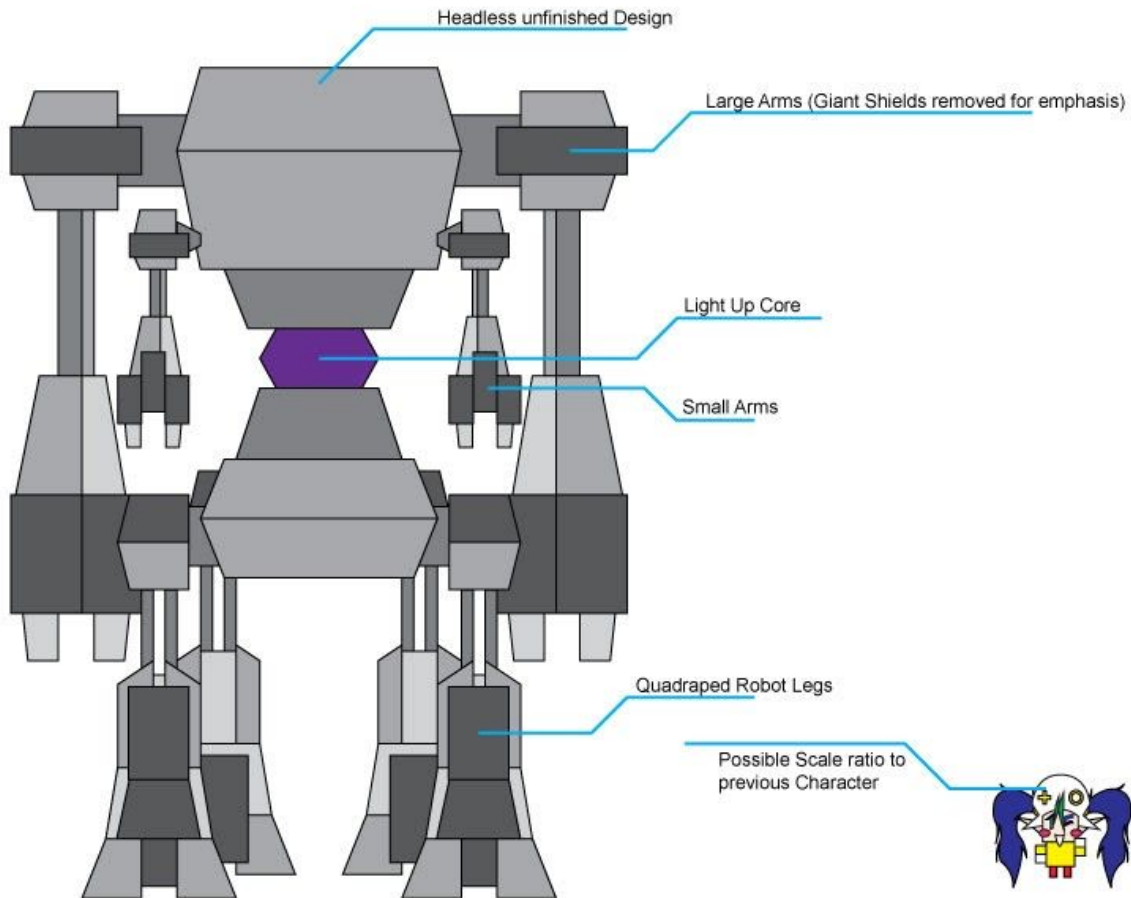

Who is the target audience for your project?

-I don't know, anyone who likes Mecha designs or Cardboard construction

## Specifications

What technologies does your project incorporate?

The Bulk of the Project would be constructed out of Cardboard with the center being plastic film. The "Core" a crystal ball prism flanked by LED lights powered by an enclosed Auduino.

Making the Robot out of cardboard wouldn;t be too complicated just matching the diagram box model or even the 3D model might be a challenge. Setting up the lights would be tough along with powering them but most of that could be looked up. The Shielding could be attached to the arms.
